

IN THE CLAIMS:

Please amend claim 2 and add new claims 23-28. Claims 1 and 3-22 remain unchanged. This listing of claims will replace all prior versions, and listings, of claims in the application.

A'

1. (Original) A computer system for generating standardized product data, the computer system comprising:
a database operable to maintain data for a plurality of known products, each known product associated with a respective standardized product code; and
a processing facility coupled to the database, the processing facility operable to receive raw data for an unidentified product from a plurality of diverse data sources each of which has its own separate identifier for the unidentified product, to compare the raw data for the unidentified product against the data for the plurality of known products, and if there is a match between the raw data for the unidentified product and the data for one of the plurality of known products, to assign the respective standardized product code of the matching known product to the unidentified product.

2. (Currently amended) The computer system of Claim 1 wherein:
the raw data comprises a raw description for the unidentified product;
the data maintained in the database comprises a separate stored description for each of the plurality of known products; and
the processing facility is operable to compare the raw description for the unidentified product against the stored descriptions for each of the plurality of known products.

3. (Original) The computer system of Claim 1 wherein:
the raw data comprises a number of field values for the unidentified product;
the data maintained in the database comprises separate field values for each of the plurality of known products; and
the processing facility is to compare a predetermined combination of the field values for the unidentified product against corresponding field values for each of the plurality of known products.

4. (Original) The computer system of Claim 1 wherein the processing facility is operable to parse the raw data into a number of separate fields values for the unidentified product.

5. (Original) The computer system of Claim 1 wherein the processing facility is operable to generate at least one guess as to a known product which is a possible match for the unidentified product.

a2 6. (Original) The computer system of Claim 5 wherein the processing facility is operable to generate a confidence measure for the at least one guess.

7. (Original) The computer system of Claim 1 further comprising an interface coupled to the processing facility, the interface operable to present the assigned standardized product code to an analyst for auditing.

8. (Original) A method performed on a computer system for generating standardized product data, the method comprising:

maintaining data for a plurality of known products, each known product associated with a respective standardized product code;

receiving raw data for an unidentified product from a plurality of diverse data sources, each data source having its own separate identifier for the unidentified product;

comparing the raw data for the unidentified product against the data for the plurality of known products; and

if there is a match between the raw data for the unidentified product and the data for one of the plurality of known products, assigning the respective standardized product code of the matching known product to the unidentified product.

9. (Original) The method of Claim 8 comprising presenting the assigned standardized product code to an analyst for auditing.

10. (Original) The method of Claim 8 comprising parsing the raw data into a number of separate fields values for the unidentified product.

11. (Original) The method of Claim 8 wherein the raw data comprises a raw description for the unidentified product and the maintained data comprises a separate stored

description for each of the plurality of known products, and wherein comparing comprises comparing the raw description for the unidentified product against the stored descriptions for each of the plurality of known products.

a¹ 12. (Original) The method of Claim 8 wherein the raw data comprises a number of field values for the unidentified product and the maintained data comprises separate field values for each of the plurality of known products, and wherein comparing comprises comparing a predetermined combination of the field values for the unidentified product against corresponding field values for each of the plurality of known products.

13. (Original) The method of Claim 8 comprising generating at least one guess as to a known product which is a possible match for the unidentified product.

14. (Original) The method of Claim 13 comprising presenting the at least one guess to an analyst for assigning a standardized product code to the unidentified product.

15. (Original) The method of Claim 13 wherein the raw data comprises a number of field values for the unidentified product and the maintained data comprises separate field values for each of the plurality of known products, and wherein generating comprises performing a pattern comparison of the field values for the unidentified product against the field values for each known product.

16. (Original) A computer system for generating standardized product data, the computer system comprising:

a database operable to maintain data for a plurality of known products, each known product associated with a respective standardized product code, the data maintained in the database comprising a separate stored description and set of field values for each of the plurality of known products;

a processing facility coupled to the database and operable to:

receive raw data for an unidentified product from a plurality of diverse data sources each of which has its own separate identifier for the unidentified product, the raw data comprising a raw description and set of field values for the unidentified product,

compare the raw description for the unidentified product against the stored descriptions for each of the plurality of known products,

if the raw description for the unidentified product does not match any of the stored descriptions for the plurality of known products, compare a predetermined combination of the field values for the unidentified product against corresponding field values for each of the plurality of known products, and

if the raw description for the unidentified product matches a stored description for one of the plurality of known products, or if all of the field values for the unidentified product match the corresponding field values for one of the plurality of known products for the predetermined combination, assign the respective standardized product code of the matching known product to the unidentified product.

17. (Original) The computer system of Claim 16 wherein the processing facility is operable to parse the raw data into the fields values for the unidentified product.

18. (Original) The computer system of Claim 16 comprising an interface coupled to the processing facility, the interface operable to present the assigned standardized product code to an analyst for auditing.

19. (Original) The computer system of Claim 16 wherein the processing facility is operable to generate at least one guess as to a known product which is a possible match for the unidentified product.

20. (Original) The computer system of Claim 19 wherein the processing facility is operable to generate a confidence measure for the at least one guess.

21. (Original) The computer system of Claim 20 comprising an interface coupled to the processing facility, the interface operable to present the at least one guess and confidence measure to an analyst for assignment of a standardized product code.

22. (Original) A method performed on a computer system for generating standardized product data, the method comprising:

receiving raw data for an unidentified product from a plurality of diverse data sources each of which has its own separate identifier for the unidentified product, the raw data comprising a raw description and set of field values for the unidentified product;

comparing the raw description for the unidentified product against the stored descriptions for each of the plurality of known products;

a' if the raw description for the unidentified product does not match any stored description, comparing a predetermined combination of the field values for the unidentified product against corresponding field values for each of the plurality of known products; and

if the raw description for the unidentified product matches a stored description for one of the plurality of known products, or if all of the field values for the unidentified product match the corresponding field values for one of the plurality of known products for the predetermined combination, assigning the respective standardized product code of the matching known product to the unidentified product.

-- 23. (New) The computer system of claim 1 wherein the processing facility is further operable to update the database with the raw data for the unidentified product, in order to improve future data comparisons.

24. (New) The computer system of claim 1 wherein, if there is no match between the raw data for the unidentified product and the data for any of the plurality of known products, the processing facility is further operable to create a new standardized product code and assign the new standardized product code to the unidentified product.

25. (New) The method of claim 8 further comprising the step of updating the database with the raw data for the unidentified product, in order to improve future data comparisons.

26. (New) The method of claim 8 further comprising the steps of:
if there is no match between the raw data for the unidentified product and the data for any of the plurality of known products, creating a new standardized product code; and
assigning the new standardized product code to the unidentified product.

27. (New) A computer system for generating standardized product data, the computer system comprising:

a database operable to maintain data for a plurality of known products, each known product associated with a respective standardized product code; and

a processing facility coupled to the database, the processing facility operable to receive raw data for an unidentified product from at least one of a plurality of diverse data sources, to compare the raw data for the unidentified product against the data for the plurality of

known products, and if there is a match between the raw data for the unidentified product and the data for one of the plurality of known products, to assign the respective standardized product code of the matching known product to the unidentified product.

28. (New) A method performed on a computer system for generating standardized product data, the method comprising:

maintaining data for a plurality of known products, each known product associated with a respective standardized product code;

receiving raw data for an unidentified product from at least one of a plurality of diverse data sources;

comparing the raw data for the unidentified product against the data for the plurality of known products; and

if there is a match between the raw data for the unidentified product and the data for one of the plurality of known products, assigning the respective standardized product code of the matching known product to the unidentified product.
